EXECUTIVE SUMMARY

Integrated Systems & Solutions Architect and Senior Java Application Engineer with over 30 years of multidisciplinary expertise in industrial electronics and embedded systems. I bridge the gap between complex hardware realities and software logic through full-cycle product development. My focus is transforming ideas into polished, commercially deployed Java/JavaFX engineering utilities and Android solutions—building scalable, multi-window architectures equipped with complex parametric calculations, automated native PDF generation, and global localization supporting multiple currencies and 8 languages.

I specialize in the “system at large”—a holistic, system architecture view where software development logic meets physical reality. My approach is disciplined: I handle the entire product lifecycle, from initial algorithmic modeling and domain analysis to UI/UX logic, database design, and commercial release. By applying deep systems engineering principles—rooted in decades of work with industrial automation and embedded systems—to modern Java development, I create high-performance, maintainable, and robust software modernization solutions. I actively integrate AI-agent tools to accelerate application development while retaining full technical control over the final product.

CORE COMPETENCIES

Software Architecture & Development

Full-Cycle Product Ownership & Project Management: Expert in the end-to-end software and application development of desktop and mobile applications, covering requirements analysis, domain modeling, and commercial release.

Architecture & Design: Solutions Architecture, System Architecture, Domain Modeling, Scalability Analysis, Performance Optimization, and Modular System Design.

Technology Stack: Java Development, JavaFX (Desktop Architecture), Android Development.

Workflow: AI-Augmented Development (utilizing LLMs for refactoring/testing), Technical Documentation, Software Modernization, and Legacy System Modernization.

Systems Engineering & R&D Strategy

Engineering Foundations: Embedded Systems, Microprocessor Programming (Assembly/C), Industrial Automation, Power Electronics, PCB Design, and TRL Assessment.

Strategic Evaluation: Technology Readiness Level (TRL) Assessment, Technical Feasibility Studies, Scalability Analysis, and Innovation Audits.

R&D Management: Leading multidisciplinary R&D teams, project roadmap evaluation, and technical service strategy.

PROFESSIONAL EXPERIENCE

Independent Solutions Architect & Product Owner (2020 – Present)

Sitia, Crete | DmV Software

Full-Cycle Product Creation: Architecting and developing commercial software products (e.g., Concrete Works Cost Estimator Pro) from a conceptual idea to a packaged desktop application. Engineered a dual-mode calculation engine with dynamic, customizable coefficients and implemented an advanced History Journal for persistent state management—featuring intelligent autofill, seamless cross-session data transfer, and complex search capabilities, which significantly optimized user workflows and data retrieval.

Architecture for Performance: Designing robust, distributed software structures. I apply rigorous systems engineering principles to ensure maintainability, leveraging low-level engineering knowledge to write performance-critical Java code.

Solution-Driven Engineering: Bridging hardware-software gaps by creating high-precision engineering utilities for Android/Java, optimized for field conditions with complex unit transformation and technical formula handling.

Technical & Operational Management (Later Career)

Cross-Functional Leadership: Directed R&D radio electronics laboratories, leading multidisciplinary engineering teams to deliver complex systems for production and commercial sectors.

Systems Architecture & Integration: Owned hardware-software integration strategies, driving the architectural decision-making required to successfully transition functional prototypes into scalable, market-ready products.

Audits & Feasibility: Conducted rigorous audits to assess the viability, scalability, and implementation readiness of diverse engineering and software solutions.

Foundational Engineering & Design (Early Career)

Full-Cycle System Design: Executed end-to-end electronic system design, from PCB development to fabrication supervision, establishing a strong foundation in hardware constraints and system reliability.

Embedded Architecture & Control: Developed low-level microprocessor-based control systems (Assembly/C), translating strict hardware constraints into optimized software execution and robust interfaces—skills directly transferable to designing highly efficient, modern application architectures.

Specialized Systems: Expertise in power electronics, digital control systems, precision measurement, and insulation resistance monitoring.

SELECTED ENGINEERING & TECHNICAL PROJECTS

Concrete Works Cost Estimator Pro (Java/JavaFX): Multi-lingual desktop application for automated calculation and PDF-based quoting, featuring localized EU formatting, persistent history logs, and full commercial packaging.

Engineering Utility Toolkit (Android/Java): High-precision mobile utility for complex unit transformations and technical formulas, featuring persistent operation history and optimized UI/UX for field conditions.

ROV Insulation Resistance Monitoring: Developed a microprocessor-based insulation resistance monitoring system for Remotely Operated Underwater Vehicles (ROV), ensuring critical system integrity.

Industrial Conveyor Automation: Designed digital control complexes for conveyor installations, providing automated management and system reliability.

Industrial Power Control: Created calculation methodology for air-gap transformers (welding/plasma) and power supply units for precision microcurrent/high-current applications.

EDUCATION & LANGUAGES

Master's Degree (Specialist) | Electrical Engineering and Electromechanics

Specialization: Industrial Electronics (Integrated 5.5-year program)

National University of Shipbuilding (NUOS) | 1982 – 1988

Languages:

Ukrainian/Russian: Native

English: Professional working proficiency (B2)

Spanish: Basic (A2)

Eligible to work in Greece. Open to collaboration on Integrated Systems & Solutions Architecture, technical consulting, R&D projects, and full-cycle development of end-user software applications where deep systems thinking and practical engineering experience create measurable value.
